 - Other languages

First example

No brackets only indentation

```
# And this is a comment.
from random import randint
number = randint(0, 9)
if number < 5:
print "0-4"
else:
print "5-9"
```

Example output

0-4

4 / 33

Functions

```
def sayMyName(name):
     print ("Your name is {0}".format(name))
3 sayMyName("Damian")
```

Basics of PythonTEX

5 / 33

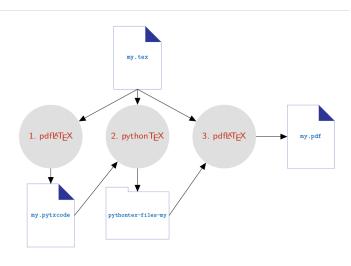

Output

Your name is Damian

Inline commands

- py
- pyc
- pys
- pyv
- pyb

Multi-line commands

- pycode
- pysub
- pyverbatim
- pyblock

Console commands

- pyconsole
- pycon

Returns text representation of it's argument.

\py{"Hello world"}

output

Hello world

9 / 33

Prints evaluated expressions that are inside curly braces preceded by exclamation mark.

_ \

output

256

Evaluates and then substitute expressions that are surrounded by curly braces proceeded by exclamation mark by their string representation.

$$1 + 1 = 2$$

AGH

Usage

It typesets but do not execute the code.

$$\begin{array}{l} 1 \\ \text{pyc}\{a = 1\} \\ \text{pyv}\{a = 256\} \\ \text{py}\{a\} \end{array}$$

It typesets and executes the code.

$$\begin{array}{l} 1 \\ pyc\{a = 1\} \\ pyb\{a = 256\} \\ py\{a\} \end{array}$$

pycode

Usage

Enclose the code that is going to be executed but not typeset.

```
1 \ begin { pycode }
 def sayMyName(name):
   return "Your name is {0}".format(name)
4 sayMyName("Damian")
5 \end{pycode}
 \py{sayMyName("Damian")}
```

output

Your name is Damian

Similar to \pys. But this time this is an environment.

```
1 \ begin { pysub }
_{2}|_{1+5} = !\{1+5\} \setminus
Function output: !{sayMyName("Damian")} \\
|4|2*32 = !{2**32}
5 \end{pysub}
```

output

$$1 + 5 = 6$$

Function output: Your name is Damian

This environment enclose the code that is typeset and executed. Does not print any printed content even if autoprint flag is set to true.

```
\begin{pyblock}
sayMyName("Damian")
a = 125
\end{pyblock}
```

```
sayMyName("Damian")
a = 125
a + a
```

This environment enclose the code that is typeset and not executed.

```
1 \ begin { pyverbatim }
2 sayMyName("Damian")
 a = 125
 a + a
 \end{pyverbatim}
```

```
sayMyName("Damian")
a = 125
a + a
```

pyconsole

console environment

Usage

This environment treats its contents as series of commands passed to an active Python console. It shows input and output of commands.

```
\begin{pyconsole}
a = [1, 2, 3]
print(a)
\end{pyconsole}
```

```
output
```

```
>>> a = [1, 2, 3]
>>> dir(a)
['__add__', '__class__', '__contains__', '__delattr__', '__delitem__'
>>> print(a)
[1, 2, 3]
```

This command executes code using emulated interpreter and shows the output back into the document, discarding the input.

```
\pycon{dir(a)}
```

```
['__add__', '__class__', '__contains__', '__delattr__', '__delitem__'
now exiting Console...
```

Frames

PytonTEX is compatible with Beamer. But beware, you need to use Beamer's fragile option for any frame containing typeset code.

Chart

Matplotlib

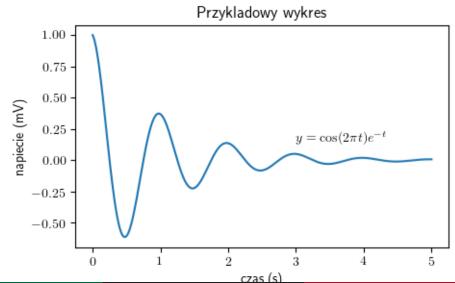

```
1 \ begin { pycode } [ chart ]
2 from pylab import *
3 def f(t):
      return cos(2 * pi * t) * exp(-t)
5 | t = linspace(0, 5, 500)
6 | y = f(t)
7 clf()
8 figure (figsize = (5, 3))
g rc("text", usetex=True)
10 plot(t, y)
11 title ("Przykladowy wykres")
12 text (3, 0.15, r"y = \cos(2 \pi t) e^{-t}")
13 xlabel("czas (s)")
14 ylabel ("napiecie (mV)")
15 savefig ("myplot.png", bbox inches="tight")
print(r"\begin{center}")
print(r"\includegraphics[scale=1.0, keepaspectratio]{myplot.png}")
print(r"\end{center}")
19 \end{pycode}
                                                                          ba a
```

File is saved to main folder by default

GPW

Using another session to improve speed of pythontex.

```
1 \ begin{pycode}[internet]
2 from internet import getSymbolInfo
3 import time
5 | wig20 = getSymbolInfo("WIG20")
  kghm = getSymbolInfo("KGHM")
7 cd = getSymbolInfo("CDPROJEKT")
  date = time.strftime("%Y/%m/%d");
9 \end{pycode}
10
11 \ begin { exampleblock } {KGHM}
12 Current price: \py[internet]{wig20} PLN
13 \end{exampleblock}
```

WIG20

Current price: 2307.06

KGHM

Current price: 112 PLN

CDPROJEKT

Current price: 81.1 PLN

Actual price for date: 2017/06/12.

External files

```
1 \ begin { pycode } [ people ]
2 from people import importPeople
g people = importPeople()
  print(r"\begin{tabular}{ | | | r }")
  print(r"{0} & {1} \\ \hline".format(people[0][0], people[0][1]))
  people.pop(0)
9 for person in people:
    print(r"{0} & {1} \ \ ".format(person[0], person[1]))
10
11
12 print(r"\end{tabular}")
13 \end{pycode}
```
